

# Rheem Is Here!

At Hubbard Heating & Plumbing, Inc., we constantly strive to offer our customers equipment of the highest quality. The addition of the Rheem line of air conditioners, furnaces, and emergency standby generators allows our customers to have an additional choice when replacing their comfort system.

A modulating comfort system from Rheem provides extraordinary comfort and energy efficiency; it is one of the most efficient air conditioners on the market. Instead of just one or two speeds like other brands, a Rheem adjusts to the outside temperature and humidity level perfectly. This is called “modulation”, and means that you only use the exact amount of energy necessary to keep your family comfortable.

You can have peace of mind with Rheem, as it was recently rated number one in reliability by Consumer Reports. With the expert installation you receive from Hubbard Heating & Plumbing, Inc., you can expect years of trouble free heating and cooling from your new Rheem comfort system.

Rheem offers many combinations of indoor and outdoor units. We will also continue to sell and service the high quality Trane equipment that many of our customers have come to trust. Our Comfort Consultant will help you design a system that fits your home and lifestyle perfectly! Call today for an appointment. 607-523-4739

## How Can We Help Keep Your Family Healthy?

Indoor air quality has just taken a giant leap forward! Trane CleanEffects has been proven to be the most effective whole house air filtration system available, removing up to 99.98% of airborne particles from your home. CleanEffects now has the distinction of being the only filtration system available that is certified by the FDA to remove viruses, such as the flu, from the air in your home.

In addition to helping allergy sufferers, asthma and emphysema patients, and cutting down on the dust build up in your home, adding a Trane CleanEffects to your Comfort System can actually help your family stay healthy.

If you are interested in finding out how this revolutionary air filtration system can help your family, give us a call today!

## Is Bigger AC Better?

In our last newsletter, we explained how an oversized furnace can cost you hundreds of dollars a year. An oversized air conditioner will also cost more to purchase and operate. Because it will “short cycle”, or turn on and off frequently, it will wear out faster and need to be replaced sooner.

The biggest problem with an oversized air conditioner is how uncomfortable they can make your home. By lowering the temperature without removing enough moisture, your home feels cold and clammy, and your family ends up just turning it off!

Our Comfort Consultant will make sure your AC system is sized perfectly for your home!

# 2 Stage Air Conditioning

With home owners being more and more concerned about rising energy costs, we at Hubbard Heating & Plumbing, Inc. are striving to offer as many energy saving options to our customers as possible. One way we are doing this is by offering two stage air conditioning systems

A conventional, or single stage AC system, fires at only one speed. So even on a mild day, when only a small amount of cooling is needed, the unit runs at full speed. A two stage system has two speeds, a low speed for the mild days, and a high speed for those really hot and muggy days. The benefit to you, the home owner, is that the system only uses that high speed when absolutely needed to keep your family comfortable. This saves you money while increasing your comfort.

Our Comfort Consultant can show you how a new high efficiency two stage air conditioning system can make this summer your family’s most comfortable ever!
